Url: [Data Visualization using Matplotlib in Python - GeeksforGeeks](#)

 what is Matplotlib?

 Matplotlib is a Python library used for creating static, animated and interactive data visualizations. It is built on the top of NumPy and it can easily handles large datasets for creating various types of plots such as line charts, bar charts, scatter plots, etc.

Syntax: `matplotlib.pyplot.bar(x, height)` Parameter: `x`: Categories or positions on x-axis . `height`: Heights of the bars (y-axis values). Example: This code creates a simple bar chart to show total bill...

what charts can be used for visualization?

Line charts, bar charts, scatter plots, and histograms, as well as pie charts.

what is RAG?

Retrieval-Augmented Generation (RAG) is the process of optimizing the output of a large language model, so it references an authoritative knowledge base outside of its training data sources before generating a response.

3.url: [What is Data Science? - GeeksforGeeks](#)

what is data science

Data science is the study of data used to extract meaningful insights for business decisions. It combines mathematics, computing and domain knowledge to solve real-world problems and uncover hidden patterns.

steps involved in data science

The steps involved in data science are:

1. Data Collection: Gathering raw data from various sources, such as databases, sensors or user interactions.
2. Data Cleaning: Ensuring the data is accurate, complete and ready for analysis.

Additionally, other steps mentioned are:

1. Data Analysis: Applying statistical and computational methods to identify patterns, trends or relationships.
2. Data Visualization: Creating charts, graphs and dashboards to present findings clearly.
3. Decision-Making: Using insights to inform strategies, create solutions or predict outcomes.
